
unittest-xml-reporting Documentation

Release 2.1.0

Daniel Fernandes Martins, Damien Nozay

Nov 27, 2018

Contents

1	Getting started	3
2	Indices and tables	5

`unittest-xml-reporting` is a `unittest` test runner that can save test results to XML files (JUnit) and be consumed by a wide range of tools such as continuous integration systems.

CHAPTER 1

Getting started

Similar to the `unittest` module, you can run:

```
python -m xmlrunner test_module
python -m xmlrunner module.TestClass
python -m xmlrunner module.Class.test_method
```

as well as:

```
python -m xmlrunner discover [options]
```

You can also add a top level file to allow running the tests with the command `python tests.py`, and configure the test runner to output the XML reports in the `test-reports` directory.

```
# tests.py

if __name__ == '__main__':
    unittest.main(
        testRunner=xmlrunner.XMLTestRunner(output='test-reports'),
        # these make sure that some options that are not applicable
        # remain hidden from the help menu.
        failfast=False, buffer=False, catchbreak=False)
```

CHAPTER 2

Indices and tables

- `genindex`
- `modindex`
- `search`
